

2T Excavator Widening Tracks

- Lower the blade so it is in contact with the ground
- Slew the machine to the opposite side of the blade while keeping the bucket close to the machine
- Position the bucket roughly 1 inch away from the ground.
- Lower the blade until both tracks start to lift off the ground.
- Push arm into the ground via the right control stick until both tracks are no longer touching the ground.
- On the left hand side under the arm rest flick the top right switch to the left.
- Use the blade stick to move the tracks in / out, they will move individually.
- Once set to where they are needed, flick the same switch to the right which will enable the front blade to be lowered.
- Slowly lower the arm first until tracks touch the ground then lower the front blade.
- Slew the machine 180 degrees so buckets are over the blade before starting to work.
